

LINE CHART

The monthly revenue trend shows fluctuations in sales over time and helps identify peak and low-performing months. This information can be used to understand seasonal sales patterns and improve future business decisions.

BAR CHART

The bar chart shows that revenue is concentrated among a few leading countries. Identifying these high-performing markets can help the business focus its marketing, sales, and customer-retention strategies on the most valuable regions.

Highest purchase of products are made in United Kingdom Lowest purchase of products are made in Spain,Belgium,sweden

HISTOGRAM

The histogram shows that most transactions have relatively low Total Price, while high-value transactions occur less frequently. Customer segmentation helps identify differences in spending behaviour and supports targeted marketing strategies.

BOX PLOT

The box plot shows that TotalPrice has greater variability compared with Quantity and UnitPrice. The presence of outliers indicates that some transactions have unusually high values, which may represent bulk purchases or expensive products.

COUNT PLOT

Most customers belong to the Low Value segment, while High Value customers form a smaller group. This suggests an opportunity to convert Low and Medium Value customers into higher-value customers through targeted promotions and loyalty strategies.

Violin plot

The violin plot shows that purchase quantities are generally concentrated at lower values on both weekdays and weekends. It helps compare purchasing patterns and identify variations in quantity between the two day types.

HEATMAP

The correlation heatmap shows that TotalPrice is positively related to both Quantity and UnitPrice. This is expected because TotalPrice is directly calculated from these two variables.

PAIR PLOT

The pair plot shows the relationships among Quantity, UnitPrice, and TotalPrice across different customer segments. High Value customers tend to be associated with higher spending, while Low Value customers are more concentrated around lower transaction values.
